

Configure Light Button

Tuesday, May 17, 2016 4:35 PM

On the front display in the cab, access the menu by touching the blue gear, touch SETTINGS, then USER SETTINGS, then touch the Configure Light Button. The popup message will describe the operation of the configurable button. The operator can configure which lights they want to turn on/off with the top left button of the front screen. It's a muscle memory button to turn ON/OFF only certain lights preferred by the operator when approaching a location.

Select the lights you want to turn ON/OFF with each press of the top left button. When your selection is complete touch the check mark gear.

Currently only available on the Raptor System (Gen3) with front display revision R09 and MMO (Gen2) revision R30:
